RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 112 pages. Dimensions: 9.7in. x 7.4in. x 0.2in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1897 Excerpt: . . . Since the pull at the rim of the rope drum is 3, 400 pounds, when running at 200 feet per second, this motor would develop about twenty horse-power; and if the elevator had to act always at this speed, it would be sufficient to describe the motor as a twenty-horsepower motor; but this would give no information as to the ability of the motor to accelerate, since, at the moment of starting, the horse-power is nothing. Example 4. A four-pole railway generator, with the armature parallel connected (giving P_i), has 440 conductors on the armature, with 16. 1×100 lines per pole; the induction factor is seventy-seven, and the force factor for 600 amperes is $77 \times 600 = 46,200$ kilodynes; the output at 450 revolutions per minute is $46.2 \times 75 = 3,465$ kilowatts; the dynamo is a General Electric Company's M. P. 4, 300 multipolar railway generator. Example 5. A ten-pole generator, armature parallel connected with 1, 440 conductors and 28.6×10 lines per pole, will have an induction factor of 412. The force factor for 1, 500 amperes is $412 \times 1,500 = 618,000$ kilodynes, and the output at eighty revolutions per minute is 825 kilowatts. The dynamo is a Westinghouse ten-pole railway generator. USE OK THE INDUCTION FACTOR IN DYNAMO CALCULATION SECTION III The induction factor forms a connecting link between the calculation for and the construction of a motor, and since it is the true basis of the dynamical action of the motor, it can be made the subject...
